1 Introduction

1.1 Motivation

Tools like Vimwiki, Vimzettel and Taskwiki provide a solid base for a Zettelkasten workflow. These are however based on *the Vim text editor*, which has a lot of advantages:

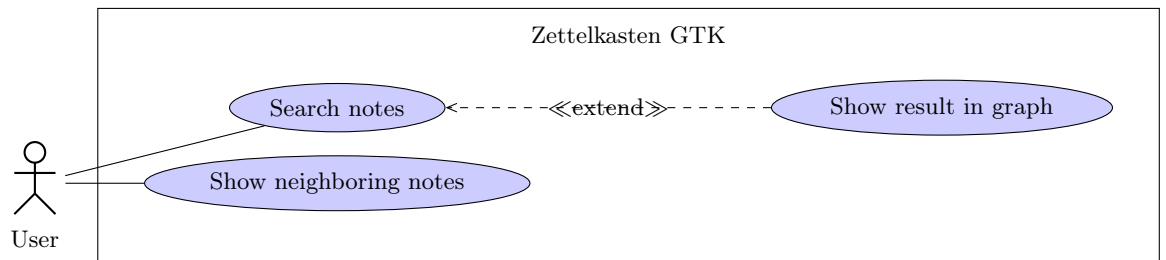

- Text editing cannot be faster
- Adding new notes is effortless
- The system is simple
- Tasks can have note links in them
- Any missing functionality can be added through Vimsript

The problem is however, that there is no GUI. Tools like *Obsidian* offer a *graph view* that enables natural viewing of the *networked structure* of the Zettelkasten. This view allows faster and easier search and navigation, but also improves the chances of *emergent ideas*.

This tool is based on a *graph view* of the Zettelkasten and allows a wide range of filters to find precisely what we're looking for.

1.2 Use cases

The graph view is *the basis* of the system and so will always be shown. The user will then be able to *adjust* this graph view.

1.3 Other features
